A time-lapse video of the space station taking pictures of Earth over the course of nearly two days has provided some stunning views of the planet's surface. The film, created by the crew of the ISS, shows over 20 images of the Earth at various times of day and night. The team has also shared a three-minute animation of the video. Using the equipment on the station and its powerful camera, the astronauts captured a lot of different kinds of images. "At any given time, we could have two different views of Earth: night time and daytime. The ISS could be over the Pacific Ocean or over the Atlantic Ocean," said Mike Hopkins, a NASA astronaut and ISS commander. "The beauty of this is that we've been able to capture beautiful, large-scale still shots of our planet from different areas of the globe, including the western United States, Australia, Chile, India, Russia and more. It's truly amazing." The video was taken from the orbital lab over a six-day period in October and was chosen as one of the best images of Earth from space by the International Space Station Users' Advisory Committee.
